

DV kits come in a variety of sizes and take the guesswork out of which filter to use in a variety of shooting situations. Use a superior filter from Tiffen and get professional results

Video Essentials DV Kit

Clear Filter - for protection.

Circular Polarizer - to increase color saturation and reduce reflection and glare

Warm UV17 - which is a combination filter. It removes 97% of ultra violet light to reduce cool blue tones of outdoor scenes and video lights while it warms up skintones for a healthier look.

Film Look DV Kit

Black Diffusion FX 1/2 - softens the scene (to suppress facial blemishes and wrinkles or give a smooth look to textured surfaces) without a hint that a filter was used.

Warm Black Diffusion/FX 1/4 - same benefits as previous, but more subtle with added warmth

Black Pro-Mist 1/2 - Tones down excessive sharpness for "film look"

Soft/FX 1 - softens unwanted details but maintains overall image clarity and focus (tones down wrinkles while leaving eyes appearing sharp).

Special Effects DV Kit

Color-Grad ND 0.6 - balances sky to foreground. Half clear to half Neutral Density 0.6 with a soft edge transition.

Pro-Mist 1/4 - tones down excessive sharpness and reduces contrast. Creates a moderate flare that adds a pearlescent glow around highlights.

ENHANCING - makes reds, rust browns and oranges "pop." Ideal for sunsets, wood tones and flowers.

Gold Diffusion/FX 1/2 - silky smooth look to textured surfaces and adds warm, gold tone to scene. Neutral colors are minimally affected, while cool colors and skintones are slightly warmed and softened.
